Hello Sir , I am Ajay K (18itr004) I have used scrap the news data from The Hindu site using the beautiful soup python library. After extracting the data the name of the person is identified by using Natural Language Tool kit with the help of StanfordNERTagger. After analysing and getting the number of times the name is repeated, it is converted to JSON format and displayed in webpage using PHP.

Sir, The last month news data is about 30,000 news. Since the compulsion time is so long I have tried with 20 news data. But in the program it will get all 30,000 data and analysed and display the result
